(1) AOCC decision epoch
Two disrupted aircraft-linked chains compete for limited recovery attention.
Observed delay signal
similar predicted successor take-off delay
decision time: before full successor execution is known
Chain A
predecessor
turnaround
successor
aircraft continuity / time exposure
state distinctions retained for the recovery assessment
Chain B
propagation / itinerary exposure
(2) From delay baseline to decision-relevant distinctions
Delay baseline
scalar severity
similar priority under delay
state added
State-informed view
Flight / Passenger / Resource
Chain A and Chain B need not rank alike
active comparis
Decision value
only if the active comparison changes
(3) The same information supports two operational decisions
Stage I - recovery screening
Compare priority across chains
limited review capacity: which chains enter detailed review?
Stage II - local recovery
Compare feasible targets within one chain
recovery effort and feasibility: activate or choose target?
