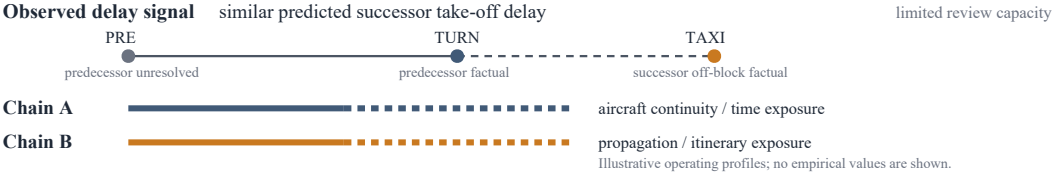
AOCC decision epoch: two disrupted chains compete for recovery attention

The delay baseline is available immediately; aircraft-linked operating context is progressively revealed.



State-informed consequence assessment

Flight / Passenger / Resource distinctions turn similar delay into a decision-relevant comparison.

The retained state determines which operational distinctions remain visible.

Stage I - recovery screening

Compare priority across chains

Limited review capacity determines which chains enter detailed recovery review.

Stage II - local recovery

Compare feasible targets within one chain

Recovery effort and feasibility determine whether local recovery is activated and how much is targeted.
