Why delay alone may not identify the right recovery action

An AOCC example of two disrupted chains at the same decision time.

Part 1. The operating situation

Two disrupted aircraft-linked chains have similar delay.

predecessor — turnaround — successor

progressively revealed operating context

Chain A

same delay signal

tight turnaround
aircraft continuity

Chain B

same delay signal

passenger connections
downstream exposure

Same delay does not mean the same recovery need.

The operating context determines which consequences matter.

Part 2. Screening

Which chains deserve detailed review?

The AOCC must allocate limited attention across chains.

Chain A candidate

Chain B candidate

limited review capacity

Part 3. Local recovery

For a shortlisted chain:
no recovery or a positive target?

The target must respect effort and feasibility.

no recovery — positive target

The same information can matter differently because the decision changes.
