Controlled information contrasts and decision value

How retained decision-time information changes supported recovery decisions

Part 1. Information contrasts

What distinction is retained under matched conditions?

Screening signal

Predicted delay priority P_D vs consequence priority P_C

same candidates, capacity, and screening rule

Temporal information

Current state to History + same current state

adds admissible operating trajectory

Uncertainty representation

All contrasts retain the same supported state, consequence mapping, and decision boundary.

Part 2. Recovery decisions

Where can the information difference act?

Common consequence mapping

Flight · Passenger · Resource

Stage I screening

same candidate set + fixed capacity

Top-K shortlist

Stage II local recovery

fixed HJ reference cohort R^*

Activation + target u*

same downstream cases across information conditions

decision object: shortlist to local target

Part 3. Decision-value evaluation

What changes under the common reference criterion?

Screening effect

- Shortlist replacement
- Retained consequence value
- Normalized screening loss L_{att}

Local-recovery effect

- Recovery activation
- Effective target change
- Normalized recovery loss L_{rec}

Decision changes and losses are evaluated under a common reference criterion.
